

Accuracy Matrix R and CL Metrics (Schematic)

Read-offs from matrix R

AA (Average Accuracy)

$$AA = (1/T) \sum_{j=1}^T a_{T,j}$$

Mean accuracy across all tasks after final task; uses last row of R.

BWT (Backward Transfer)

$$BWT = (1/(T-1)) \sum_j (a_{T,j} - a_{j,j})$$

Compares last-row entries to diagonal (just-learned); negative = forgetting.

FWT (Forward Transfer): uses the upper-triangle entries $a_{i,j}$ for $j > i$ (zero-shot on future tasks).

Diagonal (plasticity)

Last row (retention)

Upper triangle (not yet trained)

Sub-diagonal (forgetting entries)
